Synthesis of the seasonal forecast for the period AOS 2024

The analysis of current atmospheric circulation, sea surface temperature, ENSO phenomenon, dynamical and statistical models outputs show for ASO) 2024

❖ Temperature trend

According to model outputs, there is a high probability that temperatures will be above seasonal norms across the entire Tunisian territory during this period. The "**warmer than normal**" scenario is clearly favored for the upcoming season June-July-August 2024.

Forecast	Temperature
INM	***
ECMWF	Above normal
IRI	Above normal
Météo-France	Above normal
C3S multi-system	Above normal
Most likely scenario	Warmer than normal over all of the country

❖ Precipitation trend

For this period, According to the results from some climate models, the "**drier than normal**" scenario is the most likely for the ASO quarter (August-September-October). These forecasts suggest that precipitation is expected to be below the normal average for this period.

Forecast	Precipitation
INM	**
ECMWF	No signal
IRI	No signal
Météo-France	Below normal
C3S multi-system	Below normal
Most likely scenario	Drier than normal
